

Science 3PD

One lesson we had two scientists come into class to do a workshop with us about conductivity. We got to do experiments and see cool demonstrations.

We used measuring containers and different everyday plastics containers to do an experiment to see how much sand and water the containers could hold. We then discussed why the containers could hold more water than sand.

We filled the containers with both sand and water, making sure we measured how much we put in.

We made our own scales using weights and different materials and objects recording what would happen when we weighed different things.
