

Year 6 enjoyed interactive workshops where they could act out what is happening to give us night and day.

They enjoyed some outside learning where they acted as different atoms, replicating what happens to atoms in liquid, gas and solid.

Next some cross curricular learning incorporating art and science in the form of chromatography. They coloured parts of a kitchen roll, dipped them in water and watched the different colours separate.

A live dissection of a sheep's heart. Children were lucky enough to watch a live dissection of a heart where they could both see and touch the different parts of the heart. Applying what they had learnt to real life.

Workshop with scientists.

Again looking at different mixtures and combining art and science.

Making blood.

We looked at the different elements with blood and decided to try and make our own. We concentrated on getting the consistency correct and discussed the substances and how they separate and mix.

Another photo of our fantastic dissection. The whole class of 6F was very engaged in this lesson.
